

Why Anthropos?

The Anthropos platform has been co-designed and developed with leading care providers such as Home Instead and Taking Care.

Our Connected Care Platform provides intelligence that can be trusted to be accurate, dependable and actionable. The platform has been designed to evolve and extend - quickly, reliably and cost-effectively.

We are technology neutral and not tied to a particular manufacturer or supplier of devices, which allows us to incorporate the latest, most effective and best value technology as it emerges, ensuring our customers stay ahead.

The platform can already connect with over 50 different devices. This allows us and our customers to co-design the product that best suits their needs.

The Anthropos platform supports prescribers to understand the daily lives and needs of older people and make prescribing decisions which are both personalised and evidence based.

The challenges of working without supporting technology

New referrals

- Lack of insight
- Conflicting views of the individual
- Lack of careworker availability
- Snapshot information
- Hidden issues
- Unknown risk

Waiting lists

- All clients are equal until there is an assessment done
- Prioritisation of who needs care most urgently
- Correctly sizing the care package
- Identifying areas where the care could be focussed.

Existing care packages

- Dependence on face to face care visits
- Continuity of care
- Visibility of deterioration
- Visibility of improvement
- Dynamic ability to respond to change in real time.

Everyone benefits from using Anthropos

The benefits for you as prescribers

- The Anthropos platform provides you with a richer picture of the daily lives of older people than the traditional snapshots available from one-to-one visits. Effectively the platform can tell you what is happening when that older person is alone.
- Having that insight available can help you uncover hidden needs and right size the older person's care package.
- Armed with this insight and evidence you can make better informed care decisions.
- Anthropos enables Prescribers to have collaborative, evidence-based conversations with older people and their families about their needs.
- Requests for assessment and changes to care packages can be supported by validated information on the client's current status and any deterioration that has been tracked over time
- It removes the guesswork from identifying the correct level of care to provide.
- It ensures safety by facilitating the prescription of care plans which are appropriate by observing the person's strengths and areas of need.
- The platform can support older people to stay in their own homes for longer, delaying the need for residential care.
- It identifies and alerts critical events and uncharacteristic patterns of behaviour to family or to care professionals to enable quicker responses to adverse events and deterioration.
- Using the platform supports CQC ratings (assess, personalise, monitor, manage risk) and

helps deliver on four key CQC fundamental standards of care:

- Person centred
- Dignity & Respect
- Safety
- Nutrition & Hydration

- The worried well and family members can be signposted to Anthropos as a light-touch early engagement with people who may need support but do not yet meet the criteria set within commissioning
- It enables family to be more involved and become the first point of escalation instead of relying on prescribed care.

The benefits for older people and their families:

- The Anthropos platform helps older people maintain their independence for longer.
- It provides reassurance and peace of mind to families who can check remotely on the wellbeing of a loved one.
- It informs family and carers of possible incidents that need support.
- It provides insight about previously unknown and unseen changes in behaviour which could require an alteration to care planning and care delivery.
- It ensures dignity and respect by being unintrusive. It does not video or record the person, but passively provides the ability to ensure they are safe and remaining stable without the need to constantly check up on them.

How Anthropos works

We place discreet passive devices and sensors into the homes of older people to collect data that allows us to build up a picture of their daily routine.

Where many sensors can provide the data, Anthropos is unique in that it then uses machine learning to look out for meaningful changes to that routine, turning data into intelligence that can be used by care providers to answer three crucial questions:

- Is the older person OK and going about their daily routine as normal?
- Has something gone wrong suggesting that the person needs help immediately?
- Is something changing in the person's life that should be looked at?

This intelligence that Anthropos provides is shared in the form of Alerts (which indicate

that something may be wrong which requires immediate attention) and Actionable Insights (which show that something is changing or is a cause for some concern). These are delivered to care providers via an on-screen dashboard and to family members (with consent) via our Family App.

The platform can also provide easy to interpret reports and visual representations of what is happening in the home, proactively highlighting areas for action. This means Care Providers can spend less time analysing data, and more time managing what is most important

We integrate our technology into the service offering of care providers, giving them the tools and training they need to deliver true technology enabled care.
